

## **Request for Qualifications**

### **Professional Consulting Services for Nutrient Assessment Reduction Plan**

The City of Rock Island's Public Works Department is soliciting qualifications from firms interested in providing services to assist the City in developing a Nutrient Assessment Reduction Plan (NARP) with the intent on preparing the required IEPA NARP submission. The City's Mill Street Wastewater Treatment Plant (MSTP) is located at 1299 Mill Street. The MSTP has a designed average flow capacity of 8 MGD with a peak rate of 16 MGD. Because the collection system for the MSTP is a combined system, the plant has a wet weather excess flow capacity of 90 MGD. The MSTP discharges to the Mississippi River. The Southwest Wastewater Treatment Plant (SWTP) is located at 7101 38<sup>th</sup> Street West. The SWTP has a designed average flow of 1.5 MGD with a peak rate of 3.0 MGD. The SWTP discharges to Mill Creek (also known as Kickapoo Slough), a tributary to the Mississippi River.

In order to be considered, the firm must show expertise with and knowledge of NARP development and working with watershed groups. The statement should include a list of similar projects, a list of personnel who will be involved in the project along with their relevant experience in this work. In addition, a list of references, current workload, and a proposed scope of services should be included. In order to minimize the volume of information, please limit your submittal to the items listed.

If you are interested in providing consulting services for this project, please submit four (4) copies of your qualifications to the office of the Waste Water Treatment Plant Supervisor, 1309 Mill Street, Rock Island, Illinois 61201, on or before 5:00 p.m., Wednesday November 30, 2022. A selection committee consisting of Public Works staff members will review the statements for selection.

Lisa Perry,  
Waste Water Treatment Plant Supervisor
